

Using doubling and halving II

This task is about using doubling and halving to solve equations.

A doubling and halving strategy can be used to make some equations easier to solve.

- a) Use doubling and halving to write an easier equation to solve 3×14 .

$$\underline{\quad} \times \underline{\quad} = \square$$

- b) Use doubling and halving to write an easier equation to solve 18×4 .

$$\underline{\quad} \times \underline{\quad} = \square$$

- c) Use doubling and halving to write an easier equation to solve 36×5 .

$$\underline{\quad} \times \underline{\quad} = \square$$

- d) Awhina needs to solve: $15 \times 18 = \blacksquare$
Use a doubling and halving strategy to show how she could solve this equation.

Answer: _____

- e) James needs to solve: $25 \times 32 = \blacksquare$
Use a doubling and halving strategy to show how he could solve this equation.

Answer: _____
