

Number line subtraction

This task is about showing how to solve equations on a number line.

Read through the example in the box before you start.

Example:

Pere had to solve $46 - \square = 24$ using a number line.

He knew that $46 - 20 = 26$, and that $26 - 2 = 24$, so $46 - 22 = 24$

He showed this as jumps on the number line and then wrote the answer in the box:

For each question below:

- . Show how to solve the equations on the number line.
- . Write the answer in the empty box.

a) Use the number line below to show how to solve: $38 - \square = 15$

b) Use the number line below to show how to solve: $53 - \square = 19$

c) Use the number line below to show how to solve: $82 - \square = 35$
