

# Number line subtraction II

This task is about showing how to solve subtraction equations on a number line.

For the questions below show how to solve the equations on the number line.

Read through the example in the box before you start.

**Example:** Sarah had to solve this problem:  $96 - \square = 64$ .  
She knew that  $96 - 30 = 66$ , and that  $66 - 2 = 64$ .  
So she showed this on the number line and then wrote the answer in the box:

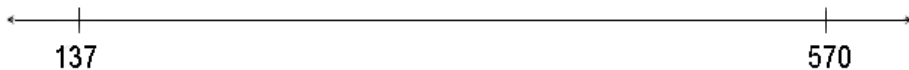

$96 - \boxed{32} = 64$

a) Use the number line below to show how to solve the equation:  $129 - \square = 86$

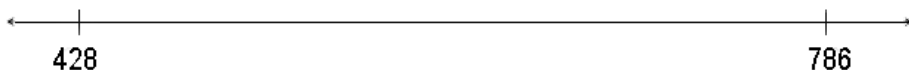

b)

Use the number line below to show how to solve the equation:  $570 - \square = 137$

c) Use the number line below to show how to solve the equation:  $786 - \square = 428$

d) Use the number line below to show how to solve the equation:  $816 - \square = 229$
