

# Burning candle diagram

---

**This task is about showing the changes that happen when a candle burns.**

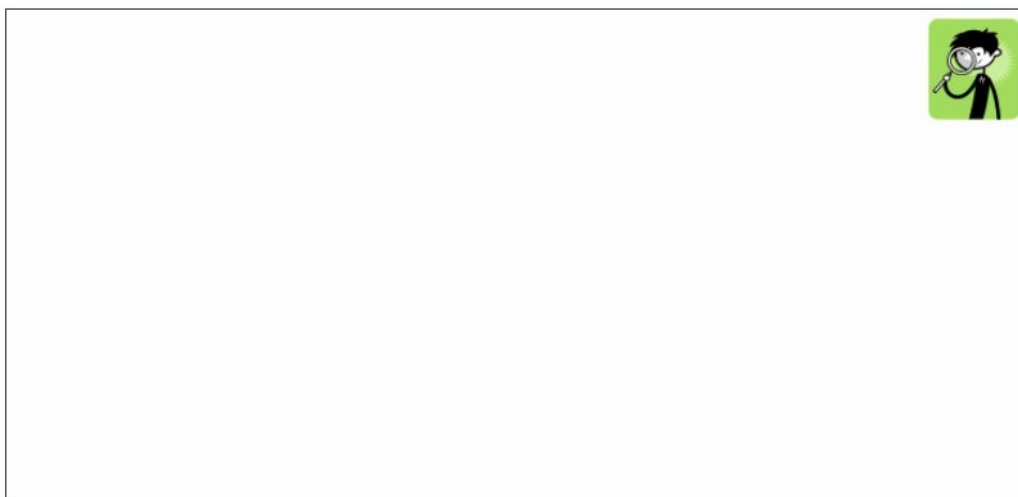

When a candle is burning, some of the wax melts, and some of it is used as fuel.

If you were able to see the molecules of wax as the candle burns, what do you think you would see happening?

Draw a picture of a burning candle to show all the ways that the wax changes.

Add labels to help other people understand your picture.
