Wanganui and Wellington water

This task is about planning a fair test.

Some students wanted to compare tap water from Wanganui and Wellington to find out which makes bubbles more easily with soap powder.

a) Students want to do a "fair test". They need to make sure that all the following are kept the same

EXCEPT the:		
0	amount of soap powder used	
0	number of shakes given to the container with the soap powder and water.	
0	temperature of the water.	
0	where the water came from.	
0	amount of water used.	

b)) The students did the experiment twice. Why did they do this?
