

Types of seeds

This task is about seed dispersal.

There are several different types of seeds which may be spread in various ways:

- Indigestible seeds.
- Seeds with hooks.
- Seeds which float on water.
- Winged or tufted seeds.
- Seeds which explode out of their pods.

Select which type of seed is most probably spread in the following questions.

Rabbits spread these seeds on high-country sheep farms.

Indigestible seeds.

Seeds with hooks.

Seeds which float on water.

Winged or tufted seeds.

Seeds which explode out of their pods.

One coconut palm is found growing on the beach of a tiny island hundreds of kilometres from the nearest land.

Indigestible seeds.

Seeds with hooks.

Seeds which float on water.

Winged or tufted seeds.

Seeds which explode out of their pods.

Birds often help in the spread of blackberry.

Indigestible seeds.

Seeds with hooks.

Seeds which float on water.

Winged or tufted seeds.

Seeds which explode out of their pods.

Over several years the owner of a cottage in deserted sand dunes notices the spread of lupins around what once was a single plant.

Indigestible seeds.

Seeds with hooks.

Seeds which float on water.

Winged or tufted seeds.

Seeds which explode out of their pods.
